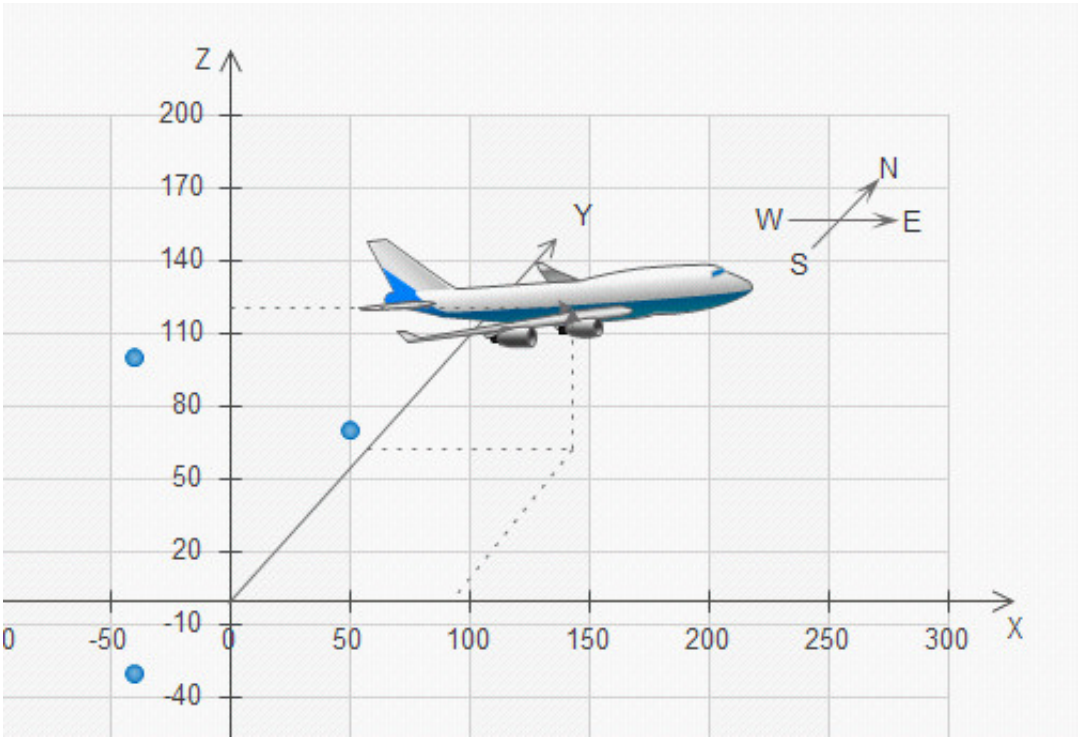
- 无人机(Unmanned Aircraft)，又称无人驾驶机，是利用无线电遥感和自备程序控制的不载人飞机。
- Z公司是一家无人机制造商，拟制造一款简易的无人机，它可以接受无线遥感指令，完成简单的动作。
- 工程师使用四元组(x,y,z,d)表示无人机位置，其中(x,y,z)为其三维坐标位置，d为其朝向(包括**E**ast,**S**outh,**W**est,**N**orth)。
- Aircraft初始位置为(0,0,0,N)，表示在原点，方向朝北

示意图如下：



Sprint-I：

- 当Aircraft收到UP指令后，向上移动一个坐标
- 当Aircraft收到DOWN指令后，向下移动一个坐标
- 当Aircraft收到FORWARD指令后，向前移动一个坐标
- 当Aircraft位于地面时(z为0时)，执行DOWN指令无响应

例如:Aircraft位于(0,0,5,N),当收到UP时，新的位置为(0,0,6,N)，继续收到DOWN时，新的位置为(0,0,5,N)，继续收到FORWARD时，新的位置为(0,1,5,N)

Sprint-I 关注点

- 用户接口定义
- 测试用例设计
- 测试用例表达力
- 变化方向：无人机位置－坐标变化
